

**ATLAS-CLUB**

48V Brushless motor. 48v Power.  
The buggy that keeps on giving.

It uses a 48v system, powered by a single 48v lithium battery via a 1100w brushless motor through the rear wheels. The buggy has all round independent suspension and dampers to ensure an impressively smooth ride even on the roughest of fairways.

There is a small digital dash board at the top of the steering column informing you of battery power, range travelled and lights status (if fitted)

The buggy is made on a solid non-folding frame, which gives rigidity and sturdiness throughout. The seat can easily be completely removed or can be folded down for loading whilst remaining in place. The steering column and handlebars can also be folded down to allow the buggy to be loaded into a vehicle or trailer.

Full electric brakes are used that disengage automatically and applied without user intervention. With the flick of a lever, the buggy can be quickly put into freewheel for manoeuvring. A part enclosure is available with protective windscreen and roof as pictured, and an additional fabric enclose is available for users who prefer the addition protection from the wind.

The Atlas buggy is built to delivery, and it surly does. Practicality is the key word. If you are looking for a golf buggy to rely on then look no more.

**Windscreen and roof kit available as an optional extra:**

Uses:  
Heavy, Long course.  
For the Serious golfer
